

Francis Oladosu

Software Engineer -, C#/.NET, Java, React

meetfran6@gmail.com | <https://horlarepo.github.io/Portfolio/>

Professional Summary

Software engineer with 7+ years building production SaaS systems across HR/payroll, fintech, and automation products. Strong in C#/.NET and Java, with production experience building statically typed backend systems, React based product surfaces, and third party integrations using REST/JSON APIs, OAuth 2.0, and webhooks. Owns scoped projects end to end, from technical design and implementation through testing, deployment, and async status updates. At NexHRM, led a multi-service HR platform and built the C#/.NET payroll module, the most business critical module in the platform currently serving 200 organizations with with over 50,000 active users, while also shipping the React interfaces and service integrations around it.

Core Skills

- **Languages:** C#, .NET, Java, TypeScript, JavaScript, PHP, Python
- **Front End:** React, Next.js, dashboard and reporting interfaces, admin workflows
- **Back End:** ASP.NET Core, Node.js, NestJS, Express.js, Spring Boot, Laravel
- **Integrations:** REST APIs, JSON APIs, OAuth 2.0, webhooks, retries, idempotency, background jobs, API error handling
- **Data & Messaging:** PostgreSQL, MySQL, MongoDB, Redis, Kafka, event-driven workflows, asynchronous processing.
- **Cloud & Delivery:** AWS, Docker, Kubernetes, GitHub Actions, CI/CD, CloudWatch
- **Quality:** automated unit, integration, and API testing, TDD, failure-mode validation, observability

Professional Experience

Technical Co-founder & Senior Software Engineer | NexHRM

2020 - Present | Lagos, Nigeria / Remote

Stack: C#, .NET, Java, Node.js/NestJS, React, PostgreSQL, Docker, Kubernetes, AWS, GitHub Actions

- Designed and led a microservices HR platform with modules implemented in different languages based on domain needs; owned the C#/.NET payroll module, the most significant module in the product, while coordinating surrounding services across Node.js/NestJS, Java and other services.
- Built a flexible payroll engine supporting hourly, daily, weekly, and monthly compensation models, multi-currency payroll, cost allocation, general ledger mapping, journal exports, and approval workflows for organizations with complex pay rules.
- Shipped the React-based operational interfaces that surfaced payroll runs, approvals, reporting views, and exception handling so HR and finance teams could complete key workflows without engineering support.
- Implemented REST/JSON service integrations and finance-facing export workflows with robust validation, retries, idempotent processing, centralized logging, and circuit-breaker patterns to handle external and inter-service failures cleanly.
- Established automated test coverage and CI/CD pipelines across critical services, enabling zero-downtime deployments on AWS/Kubernetes while improving API response times by 40% and reducing infrastructure cost by 25%.

Founder & Lead Backend Engineer | WaveSend

2024 - 2025 | Remote

Stack: Java/Spring Boot, Stripe, Flutterwave, Kafka, Redis, PostgreSQL, Docker, GitHub Actions

- Architected a cross-border money transfer platform integrating Stripe and Flutterwave through REST APIs and webhooks to support wallet funding, peer-to-peer transfers, and local withdrawals.

- Implemented idempotent transaction workflows, retry-safe async jobs, and event-driven notifications so payment flows remained reliable under duplicate webhook delivery, delayed processors, and third-party API errors.
- Built operational tooling and internal flows for transaction monitoring, AML review, and KYC-linked controls, giving support and compliance teams faster visibility into issues.
- Enforced payment and compliance rules that blocked unsafe withdrawal paths, flagged risky wallet activity automatically, and improved the platform's resilience to edge cases.

Founder & Lead Engineer | Odira

2024 - Present | Remote

Stack: NestJS, TypeScript, PostgreSQL, Docker, WhatsApp Business API, OpenRouter

- Integrated the WhatsApp Business API and AI providers to automate customer communication workflows for SMB clients, with strong attention to API reliability and operational visibility.
- Designed provider fallback logic and cost-aware routing for AI requests, reducing failure risk and keeping messaging flows stable under varying model performance.
- Owned the product end to end, from backend implementation and deployment through the customer-facing workflows that surfaced automation results.

Freelance Senior Software Engineer | Independent

2019 - 2023 | Remote

- Delivered production software for fintech, healthcare, and logistics clients using C#/.NET, Java/Spring Boot, Node.js, PostgreSQL, and React, reinforcing depth across statically typed OOP backend stacks.
- Built and consumed REST/JSON APIs, OAuth 2.0 and JWT-based authentication flows, webhook consumers, and reporting dashboards, with clear acceptance criteria and tested delivery.
- Containerized services, automated CI/CD, and documented progress and blockers clearly for async collaboration with distributed teams.

Selected Project

Enterprise Payment Gateway Platform

2025 - Present

- Designed a distributed multi-currency payment gateway with secure REST APIs, HMAC-verified webhooks, fraud controls, and strong automated test coverage across success and failure paths.
- Exposed well-documented APIs and processor integrations with data validation, rate limiting, and operational safeguards aligned with production payment workloads.

Education

Bachelor of Technology, Computer Science

Ladoke Akintola University of Technology, Ogbomosho, Nigeria | 2012 - 2017

Certification

- Microsoft Applied Skills: Accelerate App Development by Using GitHub Copilot
